Estimate the derivative of the following function at $x = -2, -1, 0, 1, 2, 3, 4, 5$.

Note: use a straight-edge and draw the tangent at each point, then use the grid lines to estimate the slope.

x	-2	-1	0	1	2	3	4	5
$f'(x)$								

Next, sketch the graph of the derivative function on the graph below, using the values you calculated in the table above.

Example 1. Given the graph of the function f below, sketch the graph of the derivative of f in each case.

Example 2. One of the functions graphed below is the derivative of the other. Determine which is the original function and which is the derivative.
